

Intelligent Vehicle Damage Assessment and Cost Estimator for Insurance Companies

TEAM ID: PNT2022TMID27302

1. INTRODUCTION:

1.1 Project overview:

In the modern world, the number of automobiles has significantly increased. Accidents happen more frequently because there are more cars on the road and more individuals are driving them fast. When an accident occurs, the parties involved submit a claim with their auto insurance to get the money needed to fix the car since, based on fraudulent claims, the insurance provider behaves improperly and withholds payments. The cause of this is claims leakage, which is the discrepancy between the sums the firm has secured and the sums it should have secured in accordance with the claims. Even if the damage to the car is obvious, the claim process will take longer than usual in accordance with business policy. In spite of the company's best efforts, processing the claim is taking

1.2 purpose:

The number of automobiles has dramatically increased in the modern era. Because there are more cars on the road and more people are driving them quickly, accidents happen more frequently. When an accident occurs, the parties involved make a claim with their auto insurance in order to obtain the funds required to fix the vehicle since, as a result of fraudulent claims, the insurance provider behaves wrongly and withholds payments.

2. LITERATURE SURVEY:

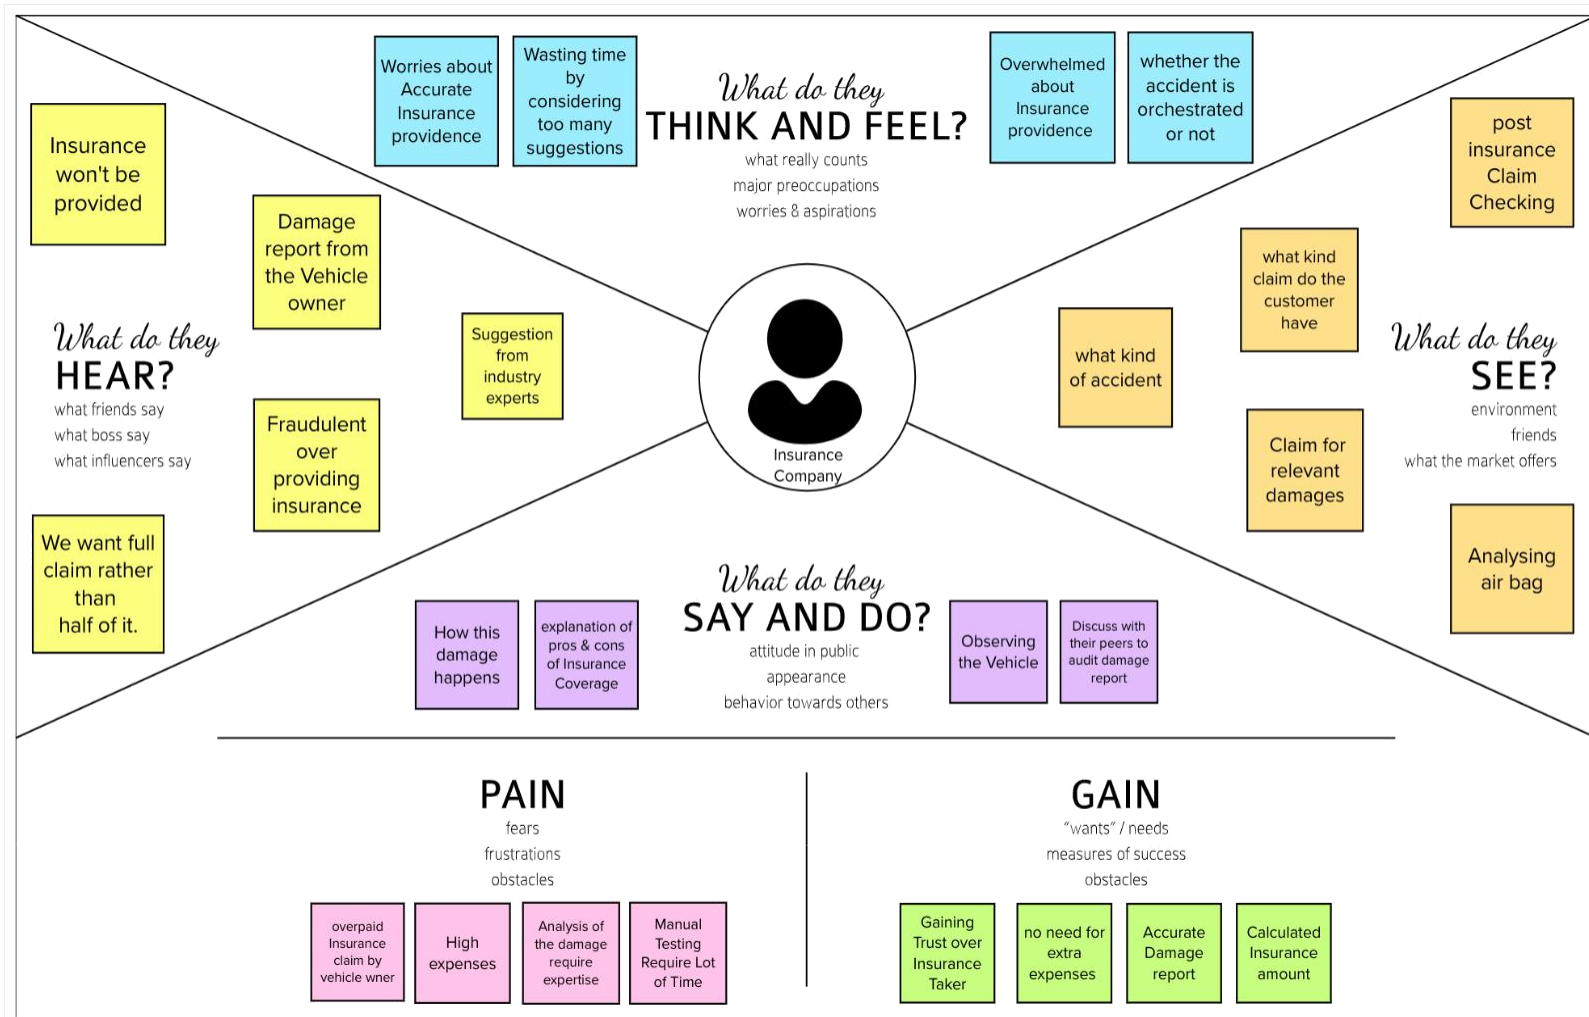

S NO.	TITLE	AUTHORS	ABSTRACT	DRAWBACKS
1.	Research on Intelligent Vehicle Damage Assessment System Based on Computer Vision	Zhu Qianqian ,Guo Weiming ,ShenYing and ZhaoZihao	In this paper, based on the demand of automobile insurance claims for intelligent transportation, combined with abundant basic data and advanced machine vision algorithms, an intelligent damage determination system of 'Artificial Intelligence Vehicle Insurance' is constructed. This paper first introduces the functions of the intelligent damage assessment system. Secondly, it discusses the realization path of each functional module in detail, and finally puts forward the vision for the future.	The drawback is to explore the innovation of insurance technology of 'AI + Vehicle Insurance'.

2.	Damage Assessment of a vehicle and Insurance Reclaim.	Vaibhav Agarwal ,Utsav Khandelwal, Shivam Kumar, Raja Kumar, Shilpa M	By reducing loss adjustment costs, improvements in the First Notice of Loss and the speed with which claims are examined and evaluated might save a lot of money in the automobile insurance claims process. Car damage is automatically identified and classified using advanced picture analysis and pattern recognition technology. A technique that compares before-and after-accident car images to automatically detect the damaged location.	The major Drawback of the Proposed model is that it only Identifies the Physical visible Damage and not Of the internal or the interior damage.
3.	Assessing Car Damage with Convolutional Neural Networks	Harit Bandi,Suyash Joshi,Siddhant Bhagat,Amol Deshpande	Manual estimation of damages in fields like construction, vehicular accidents has been the mainstay of the insurance business. However, such methods are replete with biases and inaccurate estimations. This paper deals with estimating car damage, primarily with auto insurers as our key potential customers. For this purpose, three distinct Transfer Learning approaches are used which detect the presence of damage, location, and severity of the damage.	The drawback here is Driver behavior monitoring.Machine learning enhanced solutions help in monitoring driver's behavior.

4.	Car Damage Assessment for Insurance Companies	Mandara G and Prashant Ankalkoti	The data contains three classes namely train, test and validation. Trained image is compared with the test image. Car has to be trained for many times by using epochs which means how many times the algorithm can work between the whole training dataset. In this graph they can take only two times of running the algorithm. Finally the comparison is completed lastly print the graph containing accuracy, validation accuracy, loss and validation loss.	Need for human involvement. Although the process could be absolutely automated, it still needs human involvement to detect and avoid fraudulent insurance cases.
5.	Digital Transformation in Car Insurance Industry: Streamline Recognition of Car Damage Assessment	Max Galaktionov	Digital transformation and Machine Learning technologies enable automation which is actively been used in the car insurance industry. It enables quick vehicle damage detection, improves management, cuts employee expenses, and allows to improve the overall quality of service.	The challenge is Processing of big volumes of data. The insurers need to be able to quickly assess and analyze data from various sources and provide exact estimations.

3. IDEATION & PROPOSED SOLUTION:

3.1 Empathy Map:

3.2 Ideation and Brainstorming:

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

[Brainstorm's project](#)
[34 people recommended](#)

[View template details](#)

Before you collaborate

A little bit of preparation goes a long way with the canvas. Here's what you need to do to get going.

[View notes](#)

Team gathering

Define who is participating in the session and assign each team member to a personal device.

Set the goal

Think about the problem you're looking to solve or the underlying issues.

Learn how to use the facilitation tools

Learn how to utilize the templates to create helpful and productive sessions.

[Open notes](#)

Define your problem statement

What problem are you trying to solve? Enter your problem as a short blurb for the session. This will be the focus of your brainstorm.

[View notes](#)

What is the right way to solve your problem (statement)?

Key values of the brainstorming

Successful brainstorming sessions

- Any topic
- Encourage all ideas
- Individuality
- Listen to others
- Active roles
- A possible solution

Brainstorm

Write down any ideas that come to mind that address your problem statement.

[View notes](#)

T Adhavan

- Understand the problem
- Data collection process
- Create team and test folders
- Select and test the model

P John sam daniel

- Image preprocessing
- Import model building libraries
- Save the model
- Test the model

MM Balaji

- Study the problem
- Select the model
- Collect SO-CNNs database
- Test the application

KR Aravind

- Analyze the problem
- Train and save the model
- Build three pages
- Run the application

Group ideas

Take turns sharing your ideas while clustering similar related notes to your go. Once all sticky notes have been grouped, give each cluster a number to be able to refer to it later. If a cluster is larger than six sticky notes, try and use it as you and break it up into smaller sub-groups.

[View notes](#)

Best of proposed ideas in Order

[View notes](#)

[View notes](#)

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on the grid to determine which ideas are important and which are feasible.

[View notes](#)

Importance

Feasibility

[View notes](#)

After you collaborate

You can export the most as an image or pdf to share with members of your company who might find it helpful.

[View notes](#)

Quick actions

- Share the excel**
Share spreadsheet to the cloud with collaborators to keep track of the long about the solution of the problem.
- Export the excel**
Export excel file to the cloud as PDF or PPT or other formats, share it with others to share your ideas.

Keep moving forward

- Sharing document**
Share the document with all members of the group.
- Customize your planning map**
Customize your planning map, add details and add it to the map.
- Strength, weakness, opportunities & threats**
Analyze strengths, weaknesses, opportunities, and threats (SWOT) to develop a plan.

3.3 Proposed Solution:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Intelligent vehicle damage assessment and cost estimator for insurance companies.
2.	Idea / Solution description	To perceive and determine the precise degree of automotive damage, we are building an AI model.
3.	Novelty / Uniqueness	Calculator for filing an insurance claim that is automated.
4.	Social Impact / Customer Satisfaction	Estimating the degree of car damage and providing insurance in accordance.
5.	Business Model (Revenue Model)	The primary sources of income for insurers are underwriting and investment income. The majority of an insurance company's assets are financial investments, such as listed shares, government bonds, commercial real estate, and corporate bonds. They are able to save more money and reinvest it in their own businesses by estimating the extent of car damage using our AI model and giving insurance in accordance.
6.	Scalability of the Solution	Our artificial intelligence (AI) can function at the scale, speed, and complexity necessary to achieve the goal. As our model is tested and trained using additional real-time data, its accuracy will rise.

3.4 PROBLEM SOLUTION FIT

**Project Title: Intelligent Vehicle Damage
Assessment and Cost Estimator
for Insurance Companies**

Project Design Phase-I - Solution Fit Template

Team ID: PNT2022TMID27220

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS Who is your customer? (i.e. working parents of 0-5 y.o. kids)	6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices of solutions? (i.e. spending power, budget, no cash, network connection, available devices).	5. AVAILABLE SOLUTIONS AS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? (i.e. pen and paper is an alternative to digital notetaking)	Explore AS, differentiate
	I. A commercial worker moving from one location to another. II. People belonging over the age of 18 III. Person whose vehicle was involved in an accident or sustained damage IV. An insured consumer who can make a claim	I. Unreliable network connections could make some functions inaccessible. II. Improper images or blurred images might affect the accurate performance of the application.	I. requesting an estimate of costs from a third party II. Manual computations are used for cost estimation. III. Using computationally expensive algorithms to find the harm.	
Focus on J&P, tap into BE, understand RC	2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides.	9. PROBLEM ROOT CAUSE RC What is the real reason that this problem exists? What is the back story behind the need to do this job? (i.e. customers have to do it because of the change in regulations).	7. BEHAVIOUR BE What does your customer do to address the problem and get the job done? (i.e. Directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace))	Focus on J&P, tap into BE, understand RC
	I. The primary issue will be the amount of time required to calculate the cost and percentage of damage. II. Addressing issues like this is very important identify and unify exact damage ratios cost of this damage III. The corporations did not perfectly compensate for the damage.	I. Deviation or difference between the cost calculated by the company and the actual cost II. Many advanced methods of estimating have emerged as a result of the AI field's quick development. III. Customers must do it as a result of the new regulations.	I. After an accident, the customer must upload pictures of the vehicle. II. The software will evaluate the damages immediately and present the claim amount to the users.	
Identify strong TR & EM	3. TRIGGERS TR What triggers customers to act? (i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news).	10. YOUR SOLUTION SL If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour.	8. CHANNELS of BEHAVIOUR CH 8.1 ONLINE What kind of actions do customers take online? Extract online channels from #7 8.2 OFFLINE What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development.	Identify strong TR & EM
	I. Advancing technology in the field of forecasting and estimation. II. coworkers and society calling for a quick insurance claim III. Customer seeking independence and avoiding false traps	I. Determine the damage percentage with precision. II. As it relates to the car, forecast the area of damage. III. For functionality, employ quick processing algorithms.	8.1 ONLINE I. You can browse a webpage to estimate damage using an input image. II. Rapid access to the damage assessment method based on artificial intelligence.	

4. REQUIREMENTS ANALYSIS:

4.1 Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail Registration through LinkedIN
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	User Interface	Login System,Dashboard,Uploading Image,Review and Analyze the results.
FR-4	Collection of datasets	Information about the user and their vehicle. Information about Insurance plans.
FR-5	Results	The model must be structured with high accuracy. The results obtained from the model will be displayed for the user to understand easily.

4.2 Non-functional Requirements:

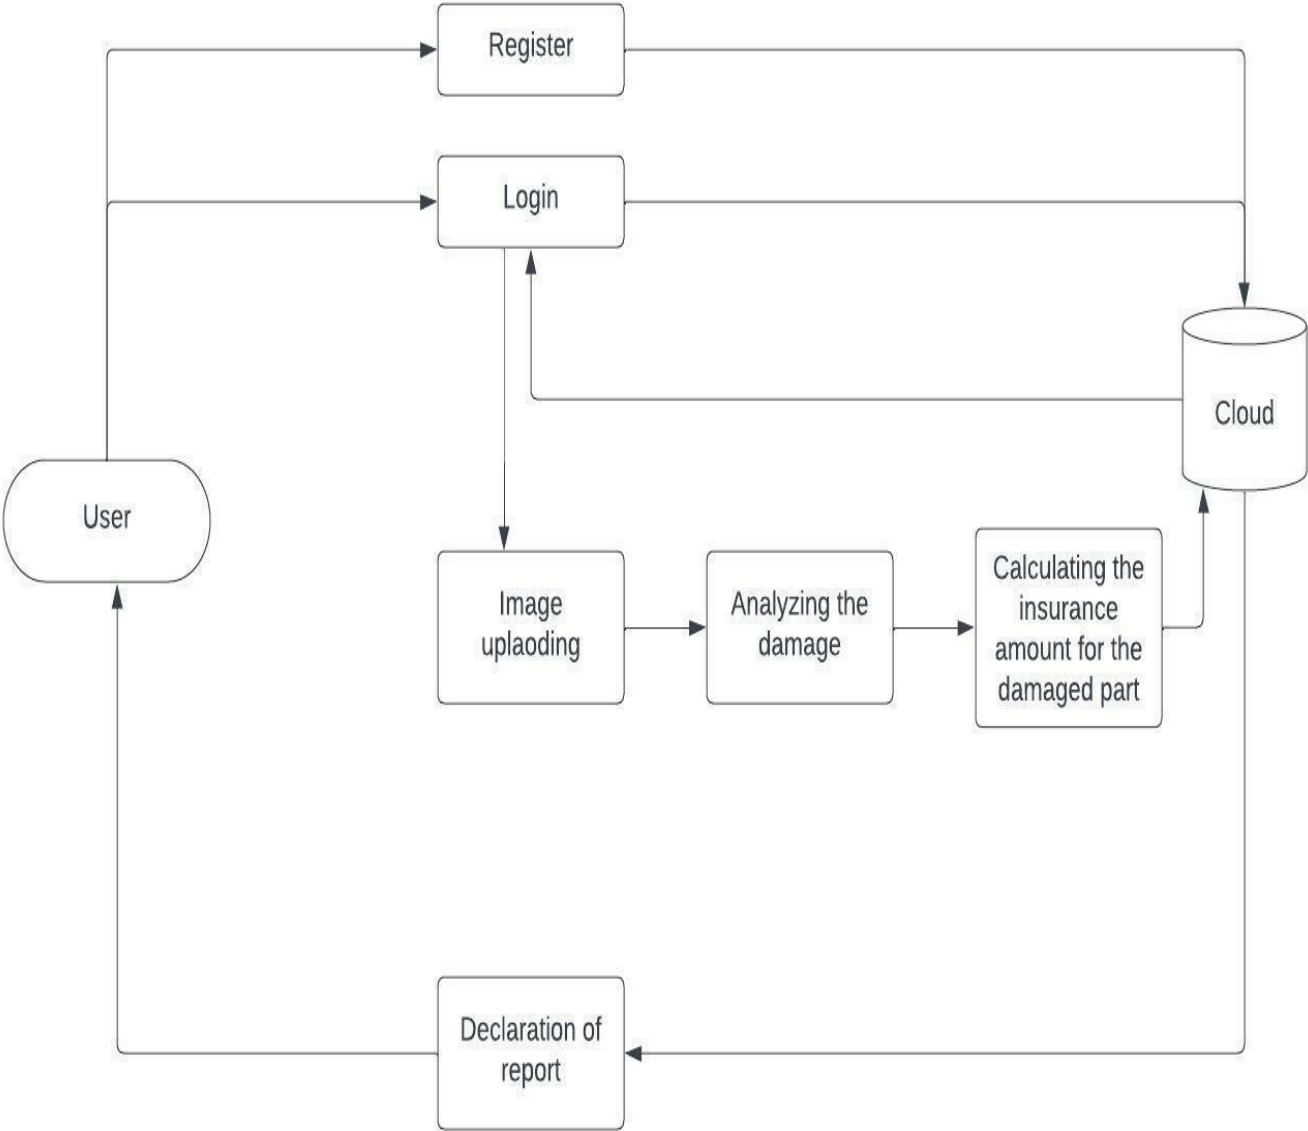

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Intelligent model for damage assessment in vehicle and cost estimate provided by insurance company.
NFR-2	Security	The authenticity of the user and the confidentiality of the user's details relating to his vehicle must be preserved.
NFR-3	Reliability	This project needs to achieve good accuracy in damage assessment as well as cost estimation so that users receive an accurate and unbiased amount of insurance.

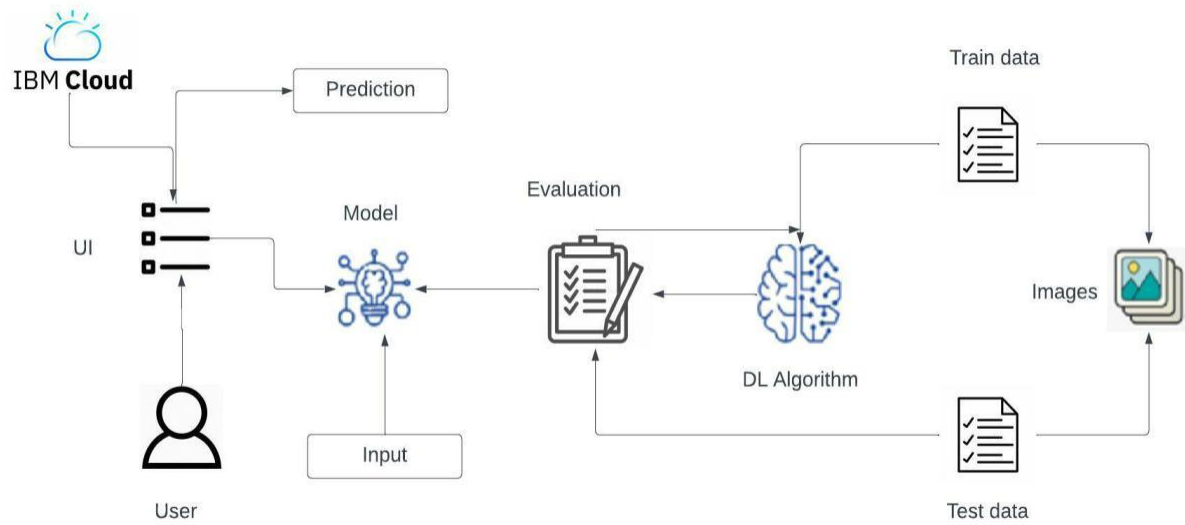

NFR-5	Availability	The webpage must be compatible with web browsers on mobile phones and computers.

5. PROJECT DESIGN:

5.1 Data flow diagram:

5.2 SOLUTION & TECHNICAL ARCHITECTURE

5.3 USER STORIES

User journey <small>by the Design Team of Adventure Interactive Ltd.</small>				
				People 2-9 Time 30 min Difficulty Beginner
1 Phases <small>High-level steps, where other people or systems may assist in the process.</small>	Requirements needs	Image Collection	Image Preprocessing and Registration	Cost Estimation
2 Steps <small>Detailed actions your user has to perform.</small>	choosing a parameter choice of prediction techniques Precision and Approximation	Take a picture of the damaged car and examine to see if the damage is obvious. Through the Internet, upload the image. Choose the damage prediction and cost estimation approach.	Assessment of vehicle damage using image detection methods. Images that are not necessary will be removed. Processing, information analysis, and interpretation are done on this image.	Finally, the damage is foreseen and the cost of the damaged car is assessed. Utilizing cutting-edge artificial intelligence techniques, it will estimate.
3 Feelings <small>What your user might be thinking and feeling at this moment.</small>	<div> Work Gonna be Done Easy to Collect Excited! </div> <div> reduced unwanted features Less work on development Some flaws might show up </div>	Capturing images on the spot and obtaining various angles of the damage gives the user confidence in the potential outcome. Excellent specificity for the desired data. Limits of detection below regulatory trigger standards. It is challenging to acquire additional images at a decent throughput.	The image will be classified based on the various damage scenarios in the data set. Difficult to maintain with a huge data set over time, require an operation to submit data, and occasionally its settings.	This will reduce the need for manual automation, resulting in significant cost savings. Normal exchange grants to a final anticipated cost. However, it is difficult to get the desired outcome.
4 Pain points <small>Problems your user runs into.</small>	lower development costs Conflict Condition New technology is required	Sometimes there are both human and technological resource shortages. One of the problems is the technical difficulties. Sometimes it results in service denial.	It might be expensive to collect a dataset. Large datasets may cause results to take longer to obtain, for Sometimes being wrong could be an issue.	It still requires a lot of data. Need for high calibre in all. It is difficult to estimate a vehicle's cost.
5 Opportunities <small>Potential improvements or enhancements to the experience.</small>	Lower development costs Higher standard demands Additional Beneficial Actions	Image detection increases productivity. It produces outcomes much more rapidly and precisely.	An great result is produced via appropriate image detection. The cost of the damaged vehicle can then be easily estimated using the criteria.	Making decisions based on facts is made possible by using data, and the process is also sped up by making it simpler to communicate predictions. Additionally, it has the benefit of making future results verification simpler.

6. PROJECT PLANNING & SCHEDULING:

6.1 SPRINT PLANNING & ESTIMATION:

Sprint	Total Story Points	Duration	Sprint Start Date		Sprint End Date (Planned)		Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	6	6 Days	24	Oct 2022	29	Oct 2022	5	29 Oct 2022
Sprint-2	6	6 Days	31	Oct 2022	05	Nov 2022	5	05 Nov 2022
Sprint-3	6	6 Days	07	Nov 2022	12	Nov 2022	5	12 Nov 2022
Sprint-4	6	6 Days	14	Nov 2022	19	Nov 2022	5	19 Nov 2022

6.2 SPRINT DELIVERY SCHEDULE:

Sprint	Duration	Sprint Start Date	Sprint End Date (Planned)	Sprint Release Date (Actual)
Sprint-1	6 Days	24 Oct 2022	29 Oct 2022	29 Oct 2022
Sprint-2	6 Days	31 Oct 2022	05 Nov 2022	05 Nov 2022
Sprint-3	6 Days	07 Nov 2022	12 Nov 2022	12 Nov 2022
Sprint-4	6 Days	14 Nov 2022	19 Nov 2022	19 Nov 2022

6.3 REPORTS FROM JIRA:

Velocity:

We have a 10-day sprint duration. The velocity of the team is 20 (points per sprint).
Let's calculate the team's average velocity (AV) per iteration unit (story points per day)

$$\text{AV} = \text{Sprint duration} / \text{Velocity}$$

$$= 6/6$$

$$= 1$$

8.TESTING:

8.1 Test Cases:

	Test Scenarios
1	Verify user is able to see login page
2	Verify if the user is able to login to the application or not?
3	Verify users are able to navigate to the register
page?	4 Verify user is able to upload images
5	Verify results

8.2 User Acceptance Testing Report:

1. Purpose of Document:

The purpose of this document is to briefly explain the test coverage and open issues of the Intelligent Vehicle Damage Assessment & Cost Estimator for Insurance Companies project at the time of the release to User Acceptance Testing (UAT).

2. Defect Analysis:

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	10	4	2	3	20

Duplicate	1	0	3	0	4
External	2	3	0	1	6
Fixed	11	2	4	18	35
Not Reproduced	0	0	1	0	1
Skipped	0	0	1	1	2
Won't Fix	0	1	0	0	1
Totals	24	14	13	26	77

3. Test Case Analysis:

This report shows the number of test cases that have passed, failed, and untested

Section	Total Cases	Not Tested	Fail	Pass
Print Engine	8	0	0	8
Client Application	50	0	0	50
Security	4	0	0	4
Outsource Shipping	3	0	0	3
Exception Reporting	8	0	0	8
Final Report Output	5	0	0	5
Version Control	2	0	0	2

8.3 Test Cases Report:

 Testcases Report.xlsx

9. RESULTS:

9.1 Performance Metrics:

Performance Testing - Artificial Intelligence

10.ADVANTAGES & DISADVANTAGES:

ADVANTAGES:

- Thanks to digitisation, the claim process is simple to use.
- Conduct a comprehensive analysis of the damaged vehicle.
- Helps in the analysis of the damaged car and the payment process by the insurance company.

DISADVANTAGES:

- The manual method for submitting an insurance claim will take longer.
- The corporation acts improperly and currently doesn't make payments as a result of false accusations.
- Poor customer service.

11.CONCLUSION:

In this research proposal, an automotive detection approach based on neural networks will be used to address the issues of car damage analysis and position and severity prediction. This project completes several tasks at once. Undoubtedly, the method will assist the insurance firms in conducting far more thorough and systematic examinations of the vehicle damage. The technology can evaluate a snapshot of the car to determine whether damage is present, where it is located, and how severe it is.

12.FUTURE SCOPE:

In our upcoming work, we'll need to employ numerous regularisation methods and a sizable dataset. We can more accurately and reliably estimate the cost of a broken automotive component if we have higher quality datasets that include the characteristics of a car (make, model, and year of manufacture), location information, the type of damaged part, and repair cost. This study prepares the path for future photo recognition initiatives with a focus on the auto insurance industry. The study was able to validate the existence of damage, its location, and its degree with accuracy by eliminating human bias. They can be further enhanced by incorporating the on-the-fly data augmentation approaches.
